                                                                                                                                                                                                                                                                                                 ö
                                                        A cDNA clone (AAT14707) codes for human CD28 antigen (AAR91433). It was derived from human T-cell tumour library in COS cells using cDNA derived from human T-cell tumour line HPB-ALL and vector piH3M (see also AAT14705), and panning of the library using antibody-coated plates. This immunoselection cloning method, developed to clone genes for cell surface antigens of human lymphocytes (see also AAT14705-04 and AAT14706-26), has general appln. Cell surface are obtd. for diagnostic and therapeutic use. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This nucleotide sequence comprises human CD28 cDNA. The cDNA was isolated from HPB-ALL human T-cell tumour cells using a novel method for cloning

The present sequence is that of CDNA encoding human cell surface antigen (CSA) CD28 (see AAY96128). The CDNA was derived from a human T-cell tumour line HPB-ALL CDNA library using a new method for cloning CSA CDNAS. The method is based upon transient expression of CSA in eukaryotic cells and physical selection of cells expressing the antigen by adhesion to (panning on) an antibody-coated substrate such as a culture dish. The predicted amino acid sequence of CD28 suggests an integral membrane protein with a single membrane-spanning hydrophobic domain terminating in a 41-amino acid cytoplasmic domain. CSA nucleic acids isolated by the method of the invention, and the proteins they encode, are useful for immunodiagnostic and immunotherapeutic applications, including the disorders in animals, including humans. These disorders include asthma, immune-complex disease, amyloidosis, parasitic diseases or multiple
Isolated nucleic acid molecule encoding the CD19 cell surface antigen, useful for immunodiagnosis and immunotherapy of immune-mediated infections or disorders, e.g. asthma, immune-complex disease, parasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human CD28; B7 molecule; immune response; cell surface receptor; Major histocompatibility complex; MHC classII; proton motor force; mitochondrial membrane potential; mitochondrial metabolism; cancer; autoimmune disease; neurodegenerative disorder; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ઠ
                                                    This nucleotide sequence comprises human CD28 CDNA. The CDNA was isolated from HPB-ALL human T-cell tumour cells using a novel method for cloning conformalian expression libraries. The method is based on transient expression of an antigen in eukaryotic cells and physical calction of cells expression in eukaryotic cells and physical selection of cells expression for an antigen by adhesion to an antibody-contend substrate. The method is useful for the isolation and molecular cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell: It has been used to clone genes contend to CD2, CD5, CD7, CD13, CD14, CD15, CD15, CD20, CD22, CD20, CD10, CD20, CD21, CD20, CD21, CD20, CD21, CD20, CD21, CD22, CD22, CD21, CD21, CD21, CD21, CD22, CD22, CD22, CD21, CD21, CD21, CD22, CD22, CD21, CD22, CD22,

"CD28 antigen"

```
The present sequence encodes human CD28 receptor. CD28 is a homodimeric glycoprotein involved in a secondary signalling pathway in the activation of T-cell proliferation. B7 on nerve cells can interact with CD28 on the immune cell leading to immune cell activation. The regulation of cell surface expression of MHC classII and co-stimulatory molecule B7 can be manipulated by regulating the intracellular dissipation of proton motor force which can be assessed in terms of mitochondrial membrane potential. These methods can be used for regulating cell growth and division to control disease processes by manipulating mitochondrial metabolism and the expression of cell surface immune proteins. They can be used for treating diseases associated with excessive cellular division, aberrant differentiation, and premature cellular death, e.g. cancers, autoimmune
of cell surface and membrane characteristics for developing products treating cancers, autoimmune diseases or neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 19; DB 3; Length 1514;

The present sequence encoding for numan lymphocyte cell surface antigen crossent sequence encoding the cobtain a new genetically engineered cDNA sequence encoding the CD28 amino acid extracellular domain sequence (amino acids 1 134 given in AA002437) and/or comprising nucleotides 100-759, 154-555 or 154-759 of the CD28 cDNA sequence. Various human lymphocyte cell surface antigen cDNA sequences (AA503172, AA503175-AA503195) are described in the present invention. The invention relates to a novel method of cloning cDNA encoding cell surface antigens and efficient construction of cDNA libraries. Also described are 2 expression vectors (AA503717, AA503174) which provide high level expression in eukaryotic host cells. The purified genes and proteins are useful for immunodiagnostic and immunotherapeutic applications, such as in the disonosts and treatment of immuno-mediated diseases, infections or disorders in animals and humans. Such diseases, infections or disorders and animals and humans. Such diseases include immune deficiency diseases of immediate type of hypersensitivity, asthma, hypersensitivity pneumonitis, systemic lupus erythematosus, rheumatoid arthritis, acute and chronic inflammation, platelet disorders, plasma and other cell neoplasms, parasitic diseases, multiple sclerosis, Guillain-Barre syndrome and tissue and organ transplant rejection. The sequences con also be used to identify, isolate and purify other antibodies and
                                                                                                                       sequence encoding for human lymphocyte cell surface antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         multiple sclerosis; rheumatoid arthritis; systemic lupus erythematosus; systemic sclerosis; dermatomyositis; polymyositis; Sjogren's syndrome; polyarteritis nodosa; vasculitis; sepsis; gene; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immune
                                                                                                                                                                                                          The sequence represents the human CD28 gene. The invention relates to a novel method for inhibiting an immune response by administering an anti-cD28 antibody. The method of the invention has immunosuppressive, antipordatic, antidabetic, antiarthritic, antitheumatic, neuroprotective, dermatological, vasotropic, antiinflammatory, neuroprotective, dermatological, vasotropic, antiinflammatory, activity. The method works to inhibit immune response by reversing or blocking T cell activation. The method is useful for inhibiting an immune response in a subject susceptible to graft-versus-host disease (GVHD), marrow transplant rejection, or having autoimmune disease including psoriasis, diabetes mellitus, multiple sclerosis, rheumatoid arthritis, systemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         lupus erythematosus, systemic sclerosis, dermatomyositis, polymyositis, Sjogren's syndrome, polyarteritis nodosa or vasculitis. The method is also useful for treating sepsis, and other autoimmune diseases including autoimmune hepatitis, autoimmune haemolytic anaemia, Behcet's disease, myasthenia gravis, cirrhosis, uveitis, ulcerative colitis, and vitiligo
Inhibiting an immune response in a subject for treating autoimmune disease such as psoriasis, diabetes mellitus, multiple sclerosis, rheumatoid arthritis, polymyositis, by administering anti-CD28 antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

New binding domain-immunoglobulin fusion protein, useful for treating a

```
The invention relates to a composition comprising a plurality of cDNAs for detecting the altered expression of genes in an immunological response. The invention also relates to a method of diagnosing or monitoring the treatment of an immunopathological condition in a sample, comprising obtaining nucleic acids from a sample, contacting the nucleic acids of the sample with an array comprising the plurality of cDNAs under conditions to form one or more hybridisation complexes detecting the hybridisation complexes with the level of hybridisation complexes with the level of hybridisation complexes ocorrelates with the presence of an immunopathological condition. Also disclosed are an expression profile comprising a microarray and a plurality of detectable complexes and a comparising a plurality of polymucleotide probes. The CDNAs are useful as hybridisable array elements in a microarray for monitoring the expression of target polymucleotides. The microarray for monitoring
                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             altered expression of genes in an immunological response or for diagnosing and treating an immunopathology, e.g. Crohn's disease, asthma or osteoarthritis.
subject having or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, Grave's disease or autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; gene; 88; immunological response; immunopathological condition;

the diagnosis of an immunopathology, such as Crohn's disease, asthma, ulcerative colltis, hypereosinophilia, irritable bowel syndrome, osteoarthritis, rheumatoid arthritis or acute monocytic leukaemia, and in identifying agents for the treatment of the diseases. The microarray may also be used in drug discovery and development, toxicological and carcinogenicity studies, forenics or pharmacogenomics. The composition may also be used in purification of asubpopulation of mRNAs, cDNAs or genomic fragments. This sequence represents a human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                            cell surface antigen; immune-mediated disorder; asthma; rheumatoid arthritis; multiple sclerosis; vasculitis; inflammation; ss;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain areaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed activity of (II) or to treat disease states involving (II). (II) is useful in gene therapy techniques to restors normal activity of (II) or to treat disease states involving or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) are useful for treathing disorders involving aberrant protein expression or biological activity. The
                               The invention relates to a cloned cDNA segment encoding a cell surface antigen selected from CD1a, CD1a, CD1c, CD2, CD5, CD7, CD13, CD14, CD16, CD16, CD2, CD2, CD2, CD2, CD2, CD2, CD31, CD2w32a, CDw32b, CD31, CD34, CD36, CD37, CD38, CD39, CD4, CD3 and their functional derivatives. The cell surface antigens of human lymphocytes prepared from the CDNAs are useful in diagnosetic and therapeutic utility in immune-mediated disorders (aschma, rheumatoid arthritis, multiple sclerosis, vasculitis and inflammation) and infections in mammals, including humans. The present
                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human, chromosome mapping, gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity.

The vectors can be used to isolate any protein by immunoselection, and clones are easy to manipulate. (Updated on 31-OCT-2002 to add missing OS field.) (Updated on 25-MAR-2003 to correct PA field.)
polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed produces.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Tyrosine suppressor gene; ASV LTR; human cytomegalovirus AD169 enhancer; HIV box; immunoselection; immune deficiency diseases; vasculitis; systemic lupus erythematosus; rheumatoid arthritis; neoplasms; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a method of therapeutically downmodulating an autoimmune response or an ongoing autoimmune response, comprising administering an antigen binding portion of an anti-CD28 antibody that blocks signaling via CD28 to the subject so that an autoimmune response or an ongoing autoimmune response in the subject is downmodulated. The methods are useful in therapeutically and downmodulated. The methods are useful in therapeutically and autoimmune disorders such as diabetes, allergy and allergic reactions, transplantation rejection, graft versus host disease, systemic lupus erythematosus, rheumatoid arthritis, myasthenia gravis, autoimmune thyroiditis, vitiligo, alopecia, inflammatory bowel disease, Addison's disease, Graves disease, haemolytic anaemia and Sjogren's syndrome. The present sequence is the human CD28 coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Downmodulating immune responses by blocking CD28-mediated signaling, useful for preventing and/or treating autoimmune disorders such as diabetes, allergic reactions, graft versus host disease, systemic lupus
                                                                                                Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                to T-cell proliferation, or T-cell proliferation relative to T-cell survival. The method involves contacting a T-cell expressing a CD28 protein with an agent that selectively modulates the activity of a CD28 survival or proliferation motif relative to the activity of a CD28 proliferation or survival motif, respectively, to selectively modulate survival motif, respectively, to selectively modulate selectively modulate selectively modulate selectively modulating survival or proliferation of the T-cell. The method may also be used to prevent or treat disorders associated with associated disorders, allergic diseases, graft-versus-host disease, lymphoproliferative disorders or autoimmune diseases. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         T-cell; cell proliferation; cell survival; cytostatic; antiallergic; immunostimulant; immunosuppressive; gene therapy; CD28; human; gene; ds.

The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The invention also encompasses expression vectors and host cells comprising a cinvention also encompasses expression vectors and host cells comprising a CA nucleic acid, a polypeptide (especially an antibody) that specifically binds to the protein, and a blochip comprising CA nucleic acid or fragments thereof. The sequences of the invention were identified using oncogenic retroviruses, which insert into the genome of the host organism or transported host norogenes or pathogenic trans-acting viral genes, meaning that cancer incidence is a direct consequence of the effects of proviral integration into host correctionma (especially breast cancer, prostate cancer, lymphoma or a propensity to carcinoma by determination of the sequence of a CA gene, or by determination of CA gene expression in particular tissues. CA nucleic acids, proteins and antibodies are also useful as the sequence represents as specifically claimed human CA nucleic acid present sequence are specifically claimed human CA nucleic acid sequences or present sequence represents as specifically claimed human CA nucleic acid specially claimed human CA nucleic acid and antibodies are also useful as the sequence represents as specifically claimed human CA nucleic acid
                                                                                                                                                                                                                                                                                                                                Human; carcinoma associated; oncogene; carcinoma; cancer; breast;
prostate; lymphoma; leukaemia; cytostatic; gene therapy; drug screening;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence of the invention. Note: The complete sequence data for this patent did not form part of the printed specification, but was obtained in electronic formst directly from WIPO at

New recombinant nucleic acid comprising a nucleotide sequence of any of
the carcinoma-associated (CA) genes, useful for screening for drug
candidates for diagnosing or treating carcinomas.
                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a recombinant nucleic acid comprising a nucleotide sequence selected from any of the fully defined carcinoma-associated (CA) genes from the 50 tables given in the specification. The CA proteins are secreted, transmembrane or intracellular proteins. The recombinant nucleic acids are useful for screening for drug candidates for diagnosing or treating carcinomas. Sequences given in ADC85215-ADC85514 represent CA genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, carcinoma associated nucleic acid, CA nucleic acid, gene; ss, carcinoma associated protein, CAP; carcinoma; leukaemia; lymphoma;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polynucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The present sequence represents a human mRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New recombinant nucleic acid, useful for treating carcinomas, lymphomas, cancers, neoplasm, adenocarcinoma, or sarcomas.

The invention

```
carcinoma associated protein amethod of screening for drug candidates, a card, a recombinant nucleic acid or expression vector comprising a recombinant nucleic card, a method of screening for drug candidates, a method of screening for a bioactive agent capable of binding to a carcinoma associated protein (CAP) encoded by a nucleotide sequence, a method of screening for a bioactive agent capable of modulating the activity of a CAP, a method of evaluating the effect of a candidate carcinoma drug, a method of diagnosing carcinoma, a method of inhibiting the activity of a CAP, a method of treating carcinoma, a method of cardinoma or propensity to carcinoma. A method of evaluating the effect of a candidate carcinoma drug comprises administering the drug to a patient, removing a corrinoma drug comprises administering the drug to a patient, removing a carcinoma drug comprises administering the mucleotide sequence. A method of diagnosing carcinoma comprises determining the expression of the gene comprising the nucleotide sequence. A method of diagnosing carcinoma comprises determining the expression of the gene from the patient the first individual and comparing the expression of the gene from or an encomparing the nucleotide sequence. A second normal tissue type from the first individual and comparing the expression of the gene from the first individual and comparing the expression of the gene from the first individual and comparing the expression indicates that the first individual and comparing the expression of the gene carcinomas comprises administering to a patient an inhibitor of CAP. Treating carcinomas comprises administering to a patient an inhibitor of CAP. Treating carcinomas comprises administering to a patient an inhibitor of CAP. The polypeptide specifically binds to the protein encoded by the nucleic acid. It comprises an antibody that specifically binds to the protein encoded by the nucleic acid. It comprises an antibody that specifically binds to the protein encoded by the polypeptide specification or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               preparing a composition for diagnosing or treating carcinoma e.g., leukaemia or lymphoma. This sequence represents a human carcinoma associated (CA) nucleic acid of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at
composition for diagnosing or treating carcinoma e.g., leukemia or
lymphoma.
                                                                                                                                                                                             The invention relates to new recombinant nucleic acids.

The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polynucleotides of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                          The invention relates to a construct for downmodulating immune response in a subject. The construct comprises an exposed surface attached with an antighor binding portion of an antibody that binds to a cytotoxic T lymphocytic antigen (CTLA)-4 or CD28 expressed on T-cell of the subject, and a major histocompatibility complex (MMC) molecule. The construct is useful for treating an individual afflicted with a disease or disorder that would benefit from downregulation of immune response. Downmodulation of the immune response is useful to downmodulate the immune response in suscinct is useful to downmodulate the immune response in autoimmune diseases such as systemic lupus erythematosus and multiple sclerosis. The construct is useful for inhibiting immune call activation and prevents production of autoantibodies or cytokines which may be involved in disease such as systemic lupus erythematosus call activation is useful in the treatment of allergy and allergic reactions ery by inhibiting IgE production. The construct is also useful for enhancing desirable immune response in a subject e.g., in situations of tunour vaccination, in viral immunity or in immunodeficiancy diseases such as AIDS and Digeorge Syndrome. Induction/chanacement of immune cell function results in increased tumour destruction in cancer patients. The construct is also useful in treating infectious diseases. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human, carcinoma associated, oncogene, carcinoma, cancer, breast, prostate, lymphoma, leukaemia, cytostatic, gene therapy, drug screening;

The invention relates to recombinant carcinoma associated (CA) nucleic acid sequences from mouse and human (ADA01482-ADA03094), and to recombinant carcinoma associated proteins (CAP) encoded by them. The

New recombinant nucleic acid encoding carcinoma associated protein, useful for preparing compositions for treating carcinomas.

WPI; 2003-587068/55.

CA nucleic acid, a polypepting tensor, and antibody) that specifically binds to the protein, and a biochip comprising CA nucleic acid or fragments thereof. The sequences of the invention were identified using concogenic retroviruses, which insert into the genome of the host organism at random. Many of these do not carry transduced host oncogenes or direct consequence of the effects of proviral integration into host protooncogenes. The CA nucleic acid sequences can be used to diagnose carcinoma (especially breast cancer, prostate cancer, lymphoma or leukaemia) or a propensity to carcinoma by determination of the sequence of a CA gene, or by determination of CA gene expression in particular tissues. CA nucleic acid, protein and antibodies are also useful as thereapeutic agents and in screening and evaluating drug candidates. The present sequence represents a specifically claimed human CA nucleic acid sequence of the invention. Note: The complete sequence data for this cancer in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel recombinant nucleic acid comprising a nucleotide sequence selected from any of the 660 sequences fully defined in the specification. A polynucleotide of the invention has cytostatic activity, and may have a use in gene therapy, or in a vaccine. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nucleotide sequence selected from any of the fully defined carcinoma-
associated (CA) genes from the 50 tables given in the specification. The
CA proteins are secreted, transmembrane or intracellular proteins. The
recombinant nucleic acids are useful for screening for drug candidates
for diagnosing or treating carcinomas. Sequences given in ADC85215-
ADC85514 represent CA genes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytostatic; gene therapy, vaccine; cancer; carcinoma-associated gene; CA; secreted; transmembrane; intracellular; ds.
recombinant nucleic acids and polypeptides are useful for treating carcinomas, e.g. lymphomas, cancers, neoplasm, adenocarcinoma, and sarcomas. The present sequence represents a human gene of the invention.
                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 51365 BP; 15176 A; 10059 C; 10474 G; 15656 T; 0 U; 0 Other;

Line invention to tractes to law tecompliand indicate acid or expression vector, an expression vector comprising a recombinant nucleic acid, a recombinant protein, a method of screening for drug candidates, a method of screening for a bioactive agent capable of binding to a carcinoma associated protein (CAP) encoded by a nucleotide sequence, a carcinoma associated protein (CAP) encoded by a nucleotide sequence, a carcinoma associated protein (CAP) encoded by a nucleotide sequence, a carcinoma drug, a method of diagnosing carcinoma, a method of carcinoma drug, a method of diagnosing carcinoma, a method of carcinoma or carcinoma drug, a method of diagnosing carcinoma or propensity to carcinoma. A method of evaluating the effect of a candidate carcinoma drug comprises administering the drug to a patient, removing a carcinoma drug comprises administering the drug to a patient, removing a carcinoma drug comprises administering the nucleotide sequence. A method of diagnosing carcinoma comprises determining the expression of carcinoma cativation of a gene comprising the nucleotide sequence. A method of diagnosing carcinoma comprises determining the expression of comparing the first individual and comparing the expression of the gene comprises of a first individual and comparing the expression of the gene comprises diditional, where a difference in the expression indicates that the first individual has carcinoma. A method of inhibiting the activity of a CAP comprises contracting an agent specific content of the protein encoded by the protein encoded by the nucleic acid. It comprises an activation of the protein encoded by the nucleic acid, it comprises an activation of a protein encoded by the nucleic acid. The nucleic acid are nucleic acid. It comprises an activation of a carcinoma comparities and intended acid. The nucleic acid is are useful for the comparities and acid. The nucleic acid are nucleic acid. It comprises an acid. The nucleic acid are nucleic acid. The nucleic acid are nucleic acid. The nucleic acid are 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          preparing a composition for diagnosing or treating carcinoma e.g., leukaemia or lymphoma. This sequence represents a human carcinoma associated (CA) nucleic acid of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to new recombinant nucleic acids. The invention

The present invention describes a method for identifying a bacteriophage coding region encoding a product active on an essential bacterial target. The method comprises identifying a nucleic acid sequence encoding a gene product that provides a bacteria-inhibiting function when an uncharacterised bacteriophage infects a pathogenic bacterium. The compound active on a target of a bacteriophage inhibitor protein in a bacterial is used to treat or prevent a bacterial infection in an animal. AAA68431 to AAA69442 and AAB16523 to AAB16954 represent bacteriophage nucleotide and protein sequences which are used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a bacteriophage coding region for treating bacterial infections comprises identifying a nucleic acid encoding a product that inhibits bacteria when a bacteriophage infects a bacterium.
                                                                                    Bacteriophage; antimicrobial; genome; identification; antibacterial; bacterial growth inhibition; bacterial infection; ds.
                                                            Bacteriophage Dp-1 complete genome sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example 17; Page 348-358; 456pp; English

The method comprises identifying a nucleic acid sequence encoding a gene product that provides a bacteria-inhibiting function when an uncharacterised bacteriophage infects a pathogenic bacterium. The compound active on a target of a bacteriophage inhibitor protein in a bacteria is used to treat or prevent a bacterial infection in an animal. AAA68243 to AAA69442 and AABI6553 to AABI6554 represent bacteriophage nucleotide and protein sequences which are used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Identifying a bacteriophage coding region for treating bacterial infections comprises identifying a nucleic acid encoding a product that inhibits bacteria when a bacteriophage infects a bacterium.
                                                                                                                                                                                                                                          Bacteriophage; antimicrobial; genome; identification; antibacterial; bacterial growth inhibition; bacterial infection; ds.

The invention relates to plant nucleotide sequences that direct seed, cleaf- and/or stem-, panicle-, root- or pollen-specific or -preferential or constitutive transcription of an operatively linked nucleic acid segment. The invention also relates to a method for augmenting a plant genome and a method of identifying a gene, where its expression is altered in the seed, leaf, stem, panicle, pollen, root or is constitutive in a plant cell. The plant is a cereal, e.g. soybean, alfalfa, sumflower, canola, cotton, peanut, tobacco or sugar beet, preferably maize, barley, cordum, rice or wheat. The polynucleotides and the polypeptides they encode are useful for manipulating crop plants to oiler improve phenotypic characteristics, to produce large quantities of oil or proteins, to incur resistance to insecticides, viruses or improve incur stress tolerance (e.g. salt, cold or drought) to ensure the plants have a high mutritional value with reduced apical dominance or dwarfism, early flowering or altered metabolic pathways. This sequence represents a plant nucleic acid of the invention. Note: The sequence data for this patent did not form part of the plants of patent did not form part of the plante of patent did not form part of the plante of patent did not form part of the sequence data for this.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New rice promoter, useful for manipulating crop plants to alter or improve phenotypic characteristics, e.g. produce large quantities of oil or proteins, resistance to insecticides, virus or fungi, stress tolerance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    developmental biology; cell signalling; insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to novel foetal polypeptides encoded by polymucleotides comprising one of 477 sequences fully defined in the specification. The foetal polymucleotides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune disorders, growth disorders (e.g. osteoporosis), thrombolytic disorders, as yestem disorders and inflammation. The present sequence was assembled using an expressed sequence tag (EST) found to be expressed in human foetal tissue cDNA libraries as the seed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel fetal proteins useful for the treatment and diagnosis of diseases associated with dysfunction of the protein e.g. cancers, immune disorders, growth disorders, thrombolytic disorders, nervous system

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA acquences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from NIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                       New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell interactions.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 3

1 Sequence 13, Application US/09536977

2 Patent No. 6649409

3 GENERAL INFORMATION:
A PAPLICANT: FOMSCRAARD, ANDERS

TITLE OF INVENTION:
TITLE OF INVENTION: WITH OPTIMIZED CODONS FOR AN HIV GENETIC VACCINE BASED

TITLE OF INVENTION: WITH OPTIMIZED CODONS FOR AN HIV GENETIC VACCINE BASED

TITLE OF INVENTION: WITH OPTIMIZED CODONS FOR AN HIV GENETIC CONSTRUCT

TITLE OF INVENTION: WATHOUT ON BASE CONSTRUCTS

FILE REFERENCE: 030307/0169

FILE REFERENCE: 030307/0169

CURRENT FILING DATE: 2000-03-29

PRIOR APPLICATION NUMBER: 06/128,558

PRIOR PELING DATE: 1999-04-09

PRIOR FILING DATE: 1999-04-09

PRIOR FILING DATE: 1999-03-29

NUMBER OF SEQ ID NOS: 118

SOFTWARE: PATENTIN OF: 2.1

SEQ ID NO 13

LENGTH: 130
